

Niagara Foot Update

With the many inquiries we have been receiving recently, we wanted to provide an update on the next generation of the Niagara Foot.

The new Model 2 is in development. It is being developed with support from the Human Mobility Research Centre at Queen's University, industry partners including DuPont Canada and non-governmental organizations. It is made in Canada using DuPont™ Hytrel®, an engineered polymer that provides superior function, energy return and durability.

Laboratory testing at Queen's University has generated very good results, demonstrating the added benefits of the new model – including its durability. After more than 2 million cycles, the foot is still performing.

Plans are now underway to conduct a number of field tests in a variety of locations. These tests will be conducted under a professional protocol.

We appreciate your patience as we make progress toward making this exciting new and affordable product available as soon as possible. Our goal continues to be to improve the lives of the people who use the Niagara Foot, and contribute to its further development for use by people around the world.

Please continue to visit this Web site for more updates.
